

# Using School Bus WiFi to Support Distance Learning

The **Kajeet SmartBus WiFi Bundles** provide internet access on the school bus, while keeping students safe and on-task with CIPA-compliant filters. With the implementation of Distance Learning, many districts are using school bus WiFi to connect students without internet at home.

The buses can be parked strategically throughout the community in neighborhoods, mobile home parks, and apartment complexes. The WiFi signals reaches 150-300' from the bus, allowing students and staff to practice social distancing while accessing the Internet.

## HOW IT WORKS

- You choose between a portable kit that can be moved to different buses as needed, or a hard installation of the router on a specific bus.
- You choose the network(s) that works best in your area - Kajeet solutions are available on all the major North American networks.
- Delayed/auto-off can be customized from the default 30 minutes up to 18 hours.
- Data is shared across entire fleet, on both devices and networks.
- Administrators have access to the Kajeet Sentinel® portal to manage filters, time-of-day controls, and data allocations.
